EXPLORATORY DATA ANALYSIS

What is exploratory data analysis?

Tukey: Looking at data to see what it seems to say.

What is exploratory data analysis?

Tukey: Looking at data to see what it seems to say.

It is important to understand what you **can do**
before you learn to measure how **well** you seem to have **done** it.

Uses of EDA

- ▶ Get a sense of things
- ▶ Data diagnostics (quality control)
- ▶ Hoping for an “a-ha” moment
- ▶ Following up “huh” moments

Data diagnostics: principles

- ▶ What might have gone wrong?
- ▶ How could it be revealed?
- ▶ Make lots of plots
 - scatterplots
 - plots against time
 - consider taking logs
- ▶ Check consistency between files
- ▶ Re-calculate derived variables and check that they match
- ▶ Outliers
 - Real or error?
 - Are the results affected?

Weird stuff I've seen

- ▶ 500 worksheet excel file where the middle 100 worksheets have the variables arranged in a different order
- ▶ Weird rounding patterns
- ▶ Missing values that shouldn't be, because derived values are not missing
- ▶ Categorical data with inconsistent categories
- ▶ Missing value codes that weren't mentioned and that could be real values (e.g., 999)
- ▶ OMG dates

Weird rounding

Identifiers

- ▶ Are the subject IDs unique?
- ▶ Are there subject or gene IDs that don't fit the typical pattern?
 - 1e5 vs 100000
 - hyphens turned into periods
 - IDs that became dates
- ▶ Subjects in one file but not in another and vice versa
 - Real, or messed up IDs?

Missing values

- ▶ As intended?
- ▶ Below detection limit?
- ▶ Telling you something about sample quality?
- ▶ Introducing bias?

Comprehensive Human Genetic Maps: Individual and Sex-Specific Variation in Recombination

Karl W. Broman,¹ Jeffrey C. Murray,^{2,3} Val C. Sheffield,^{2,4} Raymond L. White,⁵ and James L. Weber¹

¹Marshfield Medical Research Foundation, Marshfield, WI; Departments of ²Pediatrics and ³Biology, University of Iowa, and ⁴Howard Hughes Medical Institute, Iowa City; and ⁵Eccles Institute for Human Genetics, University of Utah, Salt Lake City

Summary

Comprehensive human genetic maps were constructed on the basis of nearly 1 million genotypes from eight CEPH families; they incorporated >8,000 short tandem-repeat polymorphisms (STRPs), primarily from Généthon, the Cooperative Human Linkage Center, the Utah Marker Development Group, and the Marshfield Medical Research Foundation. As part of the map building process, 0.08% of the genotypes that resulted in tight double recombinants and that largely, if not entirely, represent genotyping errors, mutations, or gene-conversion events were removed. The total female, male, and sex-averaged lengths of the final maps were 44, 27, and 35 morgans, respectively. Numerous (267) sets of STRPs

Introduction

Polymorphic DNA markers and their corresponding maps are an essential resource for localization of genes via linkage analysis, for characterization of meiosis, and for providing a foundation for the construction of physical maps. Although physical maps, including genome sequences, can provide the order of tightly linked polymorphisms, the physical maps do not provide genetic distances or other recombination data.

The era of human genome-scale genetic-map construction was heralded by the landmark paper by Botstein et al. (1980), in which both the use of DNA polymorphisms, as opposed to protein polymorphisms or other measurable phenotypes in linkage mapping and an ef-

Characterization of Human Crossover Interference

Karl W. Broman and James L. Weber

Marshfield Medical Research Foundation, Marshfield, WI

We present an analysis of crossover interference over the entire human genome, on the basis of genotype data from more than 8,000 polymorphisms in eight CEPH families. Overwhelming evidence was found for strong positive crossover interference, with average strength lying between the levels of interference implied by the Kosambi and Carter-Falconer map functions. Five mathematical models of interference were evaluated: the gamma model and four versions of the count-location model. The gamma model fit the data far better than did any of the other four models. Analysis of intercrossover distances was greatly superior to the analysis of crossover counts, in both demonstrating interference and distinguishing between the five models. In contrast to earlier suggestions, interference was found to continue uninterrupted across the centromeres. No convincing differences in the levels of interference were found between the sexes or among chromosomes; however, we did detect possible individual variation in interference among the eight mothers. Finally, we present an equation that provides the probability of the occurrence of a double crossover between two nonrecombinant, informative polymorphisms.

Introduction

Crossover interference may be defined as the nonrandom placement of crossovers along chromosomes in meiosis. Interference was identified soon after the development of the first working models for the recombination process (Sturtevant 1915; Muller 1916). Strong evidence for

matid interference is a dependence in the choice of strands involved in adjacent chiasmata. There is little consistent evidence for the presence of chromatid interference in experimental organisms (Zhao et al. 1995a), and any inference with regard to chromatid interference generally requires that data be available for all four products of meiosis (so-called “tetrad data”);

Capturing EDA

- ▶ what were you trying to do?
- ▶ what you're thinking about?
- ▶ what did you observe?
- ▶ what did you conclude, and why?

Avoid

- ▶ “How did I create this plot?”
- ▶ “Why did I decide to omit those six samples?”
- ▶ “Where (on the web) did I find these data?”
- ▶ “What was that interesting gene?”

Basic principles

Step 1: slow down and document.

Step 2: have sympathy for your future self.

Step 3: have a system.

Capturing EDA

- ▶ copy-and-paste from a script
- ▶ grab code from the log (e.g., `.Rhistory`)
- ▶ Write an informal report (R Markdown or Jupyter)
- ▶ Write code for use with the KnitR function `spin()`

Comments like `#' This will become text`

Chunk options like so: `#+ chunk_label, echo=FALSE`

If you torture the data long enough,
it will confess to anything.

– Tukey
